SUMMARY

Smart Contract Engineer working across EVM infrastructure, custom chain deployments, and Ethereum client internals. Built PoA networks on Reth with Lighthouse consensus, shipped Solidity governance systems, and run DevOps pipelines (Docker, K8s, AWS) in production.

EDUCATION

Lokmanya Tilak College of Engineering

Mumbai, India

Bachelor of Engineering in Computer Engineering – 8.6 GPA

May 2025

TECHNOLOGIES & OPEN SOURCE

- **Blockchain & EVM:** Solidity, Foundry, Hardhat, Ethers.js, Viem, Wagmi, Avalanche Subnets, EVM Architecture
- **Languages & Frameworks:** Rust, JavaScript, TypeScript, Next.js, Express.js, Node.js
- **DevOps & Cloud:** AWS, EC2, Docker, Kubernetes (K8s), Justfile, Cloudflare Workers
- **Open Source:** Contributed to Foundry-rs – fixed incorrect `vm.parsekeys` behavior and submitted patch via PR improving test utility docs.

EXPERIENCE

Qoneqt (Human Quotient Pvt Ltd)

Remote

Blockchain Engineer

April 2025 – Present

- Deployed custom L1 chains on Avalanche Subnets with tailored precompiles (Gas Manager, Reward Manager, Custom Fees, Difficulty) – cut block time by 40% over default config, directly boosting throughput across the platform's active wallets.
- Built a custom Subgraph + fallback Node.js indexer for the Oboswap DEX, dropping query latency from ~2s to under 200ms; handled 3x volume spikes on trade feeds with zero downtime.
- Implemented gasless transactions (EIP-712 / EIP-2771 meta-tx), removing the first-transaction friction that was causing 60%+ user drop-off during onboarding.
- Shipped on-chain governance (signer registry, treasury, chain config) so the team could push chain upgrades without coordinated hard forks or node restarts.

Attenomics Labs

Remote

Solidity Engineer

- Wrote end-to-end test suites across the full contract surface – reentrancy guards, access control, integer overflows, and storage collision vectors.
- Built internal tooling to flag front-running, MEV sandwich vectors, and price manipulation risks in pending tx flows before mainnet deployment.
- Audited proxy/UUPS upgrade patterns for storage layout conflicts and initialization bugs, preventing fund-lock scenarios in production.

PROJECTS

ClawBNB — Github — (Next.js, Solidity, Cloudflare Workers, BNB Chain)

- No-code AI agent builder on BNB Chain – users drag 20+ skill blocks (mint tokens, fetch prices, conditional logic, API calls) onto a canvas, wire workflows, and deploy with a single tBNB micropayment.
- Each agent gets a dedicated server-managed wallet, signs and broadcasts transactions autonomously – no manual approvals. Pay-per-deploy pricing (skills × 0.001 tBNB) verified on-chain before deployment, no wrapped tokens or approve steps.
- Agents compile to self-contained ES module Workers deployed on Cloudflare's edge network, giving sub-100ms cold starts globally.

BlindPool — Github — (Solidity, ZK Proofs, Uniswap CCA, TypeScript)

- Privacy fork of Uniswap's Continuous Clearing Auction – sealed-bid scheme where participants submit hashed commitments on-chain, keeping bid prices and identities hidden until auction close to eliminate MEV sniping.
- Designed commitment-reveal flow that blocks sandwich attacks and front-running by bots, making token launches materially fairer for retail bidders.
- Full auction lifecycle (prepare → deploy → bid → clear → settle) enforced on-chain with ZK proof verification for confidentiality guarantees.

Custom-reth-chain — Github — (Rust, Solidity, Docker, Justfile)

- Full PoA blockchain on Reth with EVM compatibility across all hardforks (Frontier through Prague), including consensus validation, signer-key block production, and on-chain governance contracts for chain config and treasury.
- 194 passing tests on consensus, payload building, and node logic. Dockerized deployment with Justfile automation and custom RPC namespaces for live monitoring.

sigScan — Github — (TypeScript, Solidity, solc)

- VS Code extension + CLI for extracting Solidity function signatures, events, and errors from Foundry/Hardhat projects – includes gas analysis, storage layout inspection, ABI generation, and contract size checks against EVM deploy limits.
- Real-time hover details, function call graphs, and compilation caching built to catch gas regressions and deployment blockers before they reach CI.
